

Key Points

- Certified quality
- Medium fine texture
- Improved cold tolerance
- Excellent drought tolerance
- Increased turf density for wear and durability

Characteristics and areas of use

Bermuda Triangle is a blend of Mohawk, Sultan, and SWI 1001. These varieties have been selected for their individual attributes and together they produce a high quality playing surface. These attributes include a medium fine texture, dark green colour, excellent drought tolerance as well as an improved cold tolerance. Bermuda Triangle mix can be used in a wide range of situations from golf fairways and tees to sports fields, parks and schools.

Breeding history

All three cultivars in Bermuda Triangle have been bred by Seeds West Inc, a division of Pennington Seeds. Seeds West Inc is the world's largest breeder and producer of seeded bermuda grass and is based in Arizona, U.S.A.

Sowing rate and maintenance

Seeding rates for new turf applications is between 1 - 2 kg/100 sq meters or 100 – 200 kg/ha and for repairs to existing turf 0.25 – 0.5 kg/100 sq meters or 25 – 50 kg/ha. Bermuda Triangle should be planted when soil temperatures are consistently above 18°C in full sun on a well-drained soil site. Care must be taken not to cover the seed with too much soil – no more than 2 cm. Good soil to seed contact is paramount and consistent soil moisture around the seed must be maintained for about 1 to 2 weeks.

Under ideal conditions, germination occurs within 10 to 14 days and full coverage may be attained in 4 to 6 weeks. Mowing may begin when grass is 1/3 taller than desired mowing height. It is recommended that no more than 1/3 of leaf blade be removed per mowing.
